(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymerase at the polymerase and T4 polymerase at the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (qi|4732114 qib|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

(http://www.nax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil 4732114 (jbl AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

One of the plants has an expression cassette comprising a male-sterility gene (e.g. barnase gene), and the other plant has an expression cassette comprising a fertility restorer gene (e.g. barstar gene), integrated into the genome. The fartility restorer gene is capable of preventing the activity of the male-sterility gene. The plant pair is useful for producing hybrid seed. Plants developed from the hybrid seed have agronomic performance, genetic stability and adaptability to different genetic backgrounds. PCR primers AAH2429-31 were used to amplify fragments of a vector in a transgenic plant which carries the TA29-barnase transgene.
                            seed, cells or tissues, characterised by harbouring a specific transformation event, particularly by the presence of a male-sterility gene, at a specific location in the Brassica genome. Transgenic transgenic plant with a male-fertile Brassica plant and harvesting the hybrid seed from the transgenic Brassica plant and harvesting the hybrid seed from the transgenic Brassica plant.

The present sequence is PCR primer which is used to recognise foreign DNA and a flanking sequence of elite event MS-B2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Transgenic winter oilseed rape plants suited for producing hybrid seed with improved qualities, comprises a male sterility gene and fertility restorer gene, integrated into the genome

Transgenic Brassica plant is useful for producing a hybrid seed by crossing the transgenic plant with a male-fertile Brassica plant and harvesting the hybrid seed from the transgenic Brassica plant.

The present sequence is right (5') border flanking region of elite event MS-B2.

                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a transgenic Brassica plant or its seed, cells or tissues, characterised by harbouring a specific transformation event, particularly by the presence of a male-sterility gene, at a specific location in the Brassica genome. Transgenic Brassica plant is useful for producing a hybrid seed by crossing the transgenic plant with a male-fertile Brassica plant and harvesting the hybrid seed from the transgenic Brassica plant.

The specification describes a pair of transgenic winter oilseed rape plants suited for producing hybrid seed. One of the plants has an expression cassette comprising a male-sterility gene (e.g. barnase gene), and the other plant has an expression cassette comprising a fertility restorer gene (e.g. barstar gene), integrated into the genome. The fertility gene. The plant pair is useful for producing hybrid seed. Plants developed from the hybrid seed have agronomic performance, genetic stability and adaptability to different genetic backgrounds. The present sequence represents a fragment from a vector comprising the
                                                           hybrid seed; male-sterility gene; barstar gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Transgenic plant; winter oilseed rape; hybrid seed; male-sterility gene; fertility restorer gene; barnase gene; barstar gene; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The specification describes a pair of transgenic winter oilseed rape plants suited for producing hybrid seed. One of the plants has an expression cassette comprising a male-sterility gene (e.g. barnase fertility restorer gene (e.g. barnatar gene), integrated into the genome. The fertility restorer gene (e.g. barstar gene), integrated into the genome. male-sterility gene. The plant pair is useful for producing hybrid seed. Flants developed from the hybrid seed have agronomic performance, genetic stability and adaptability to different genetic backgrounds. The present sequence represents the the right flanking region of a vector.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Transgenic winter oilseed rape plants suited for producing hybrid seed with improved qualities, comprises a male-sterility gene and fertility restorer gene, integrated into the genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                        HindIII-Ort in the 3' polylinker (1032-1037) for cloning the cassette in the Ti-vector pGA471. Agrobacterium tumefaciens is transfected.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                               The specification describes a pair of transgenic winter oilseed rape plants suited for producing hybrid seed. One of the plants has an expression cassette comprising a male-sterility gene (e.g. barnase fertility restorer gene (e.g. barstar gene), integrated into the genome. The fertility restorer gene (e.g. barstar gene), integrated into the genome. male-sterility gene. The plant pair is useful for producing hybrid seed. Plants developed from the plant pair is useful for producing hybrid seed. The present sequence represents a fragment from a vector comprising the present sequence represents a fragment from a vector comprising the plants.
                                                                                                                                     Transgenic winter oilseed rape plants suited for producing hybrid seed with improved qualities, comprises a male-sterility gene and fertility restorer gene, integrated into the genome

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The Legumin gene B4 is used. The unique BgIII-Ort (815-820) site is for ligating foreign DNA and the HindIII-Ort in the 3' polylinker (1080-1085) for cloning the cassette in the Ti-vector pGA471. The cassette is cloned into the binary Ti-vectors pGA471 and Agrobacterium tumefaciens is transfected.

                                                                                                                                                                                                                                                                                                                                                                                                                                                   The HindIII-ECORI fragment (AAT39337) of plasmid pTS88 contains barstar DNA under control of a 35S promoter. The plasmid was used with prS174 (see also AAT39336) contg. barnase DNA under control of the stamen-specific promoter EI to produce male sterile rice cv. Kochihibiki transgenic plants, and with plasmid pVB136 (see also AAT39338) contg. barnase DNA under control of the stamen-specific PCA55 promoter to produce male sterile malize plants. Expression of barnase (a ribonuclease) in the stamen leads to male sterility. Constitutive expression of barstar counteracts possible low level expression of barnase DNA in non-stamen tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                      Prodn. of male sterile plants by transforming with a chimaeric construct - comprising a male sterility DNA e.g. barnase and a co-regulating gene, e.g. barstar, into the nuclear genome, useful for generating hybrid cultivars

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                             Two transformed corn plants were analysed by means of Southern hybridisation. As a probe, a 1184 bp EcoRI-HindIII fragment derived from another plasmid was used. The sequence of that plasmid is given below. Results showed that at least a chimeric neo gene was integrated into the plant genomic DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ŏ
                                                                                                                                                                                                                                                                                             The present DNA sequence is the plasmid DV131, that is used in the generation of GFP:NPTII fusion protein constructs. It contains an expression cassette comprising, a promoter from the maize 13 oleosin gene, the coding sequence of EGFP:NPTII translational fusion, excised from DV126 and the Tr7 terminator. This plasmid is used to carry a chimeric gene, comprising an aleurone-specific promoter like 13, that is operably linked to the gene encoding a screenable marker, like Green fluorescent protein (GFP), luciferase or maize R gene. The gene fusions allow both selection and screening of transformants. The aleurone-specific promoters direct the expression of the marker genes in embryogenic tissues, allowing selection and screening of viable creaming of transgenic seads. Screening of transgenic seads avoids the need for growing and assaying of seeds for transgenes and allows implementation of automated seed screening techniques for the identification of

/note="Vector: PWD42D1; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared hydrocitides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gil4732114|gb|AF129072.1), a copy-number

with a modified polylinker; plasmid DNA from the
normalized library NCI CGAP_PT22 was prepared, and ss
circles were made in vitro. Following HAP purification,
this DNA was used as tracer in a subtractive hybridization
reaction. The diver was PCR-amplified cDNAs from a pool
of 5,000 clones made from the same library (cloneIDs
985608-986759, 1101192-1101959, and 1217928-1220615).
Subtraction by Bento Scares and M. Fatima Bonaldo. "

XhoI: The CDNA library was constructed from floral
meristematic mRNA provided by Dr. Halina Knap of Clemson
University. Complementary DNA was synthesized from mRNA
using a primer consisting of a poly(dT) sequence with a
XhoI restriction site. ECORI adapters were ligated to the
blunt-ended cDNA fragments followed by XhoI digestion. The
CDNA fragments were directionally cloned into the
ECORI-XhoI restriction site of the pBluescript vector. The
ligated cDNA fragments were transformed into DHIOB host
cells (GibcoBRL). This library was constructed in the
laboratory of Dr. Randy Shoemaker."

Genomic DNA isolated from broth cultures of E. histolytica
using a method described by Clark and Diamond, L.S. (1993) Entamoeba histolytica: a
method for isolate identification. Exp. Parasitol.
77:450.) The DNA was mechanically sheared to give a
tight size distribution (-2 kb). The v + i method used for
the library construction is described in detail in Smith,
H.O. and Venter, J.C. (Making small insert libraries for
whole genome shotgun sequencing projects. In Genome
Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barell, Oxford University Press, 1999)."

High-efficiency full-length cDNA cloning. Methods Enzymol. 303,
Genomic DNA isolated from broth cultures of E. histolytica using a method described by Clark and Diamond, L.S. (1993) Entamoeba histolytica: a method for isolate identification. Exp. Parasitol. 77:450.). The DNA was mechanically sheared to give a tight size distribution (-2 kb). The v + i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."

On Aug 29, 2000 this sequence version replaced gi:9926454.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;
